

SPAS 360

The Bible

The single source of truth — how to run Magic City Home Leisure on one system, and how to build on it. Sales, service, inventory, customers, Ari, and the design law.

Welcome to SPAS 360

SPAS 360 is the operating system for Magic City Home Leisure. It replaces four separate tools with one system where every part of the business shares the same data — enter a customer once and they exist everywhere: on the sales board, the service schedule, the inventory ledger, and in Ari's memory.

It replaces	With
HubSpot (CRM, pipeline, lead tracking)	The Deals board — live kanban with the whiteboard-style sales board on top
Jobber (service scheduling, techs)	The Service Schedule — same colors, same drag-to-schedule, plus time clock and photos
Podium (business texting)	Customer texting from the store number, visible to managers (see §13)
The Excel inventory workbook	Live two-store inventory with real statuses, margins, and search

The big idea: two sides, one dataset. The business runs as a Sales side and a Service side — different people, different workflows — but the data flows between them automatically. When a deal is won on the sales board, a delivery job appears in the service queue by itself. QuickBooks stays your accounting system (sync is on the roadmap).

■ *This manual is the single source of truth for how the app works. When something in here looks different from the app, the app is newer — ask for the manual to be regenerated.*

Getting Started & Roles

Go to **spas360solo.vercel.app** and sign in. The app works in any modern browser on desktop, tablet, or phone — technicians are expected to live in it on their phones.

Every person gets a role, and the role decides what they see and where the app opens:

Role	Opens to	Can do
Owner / Manager	Dashboard	Everything: all deals and jobs across both stores, inventory editing and deletion, team and role management, customer reassignment, all conversations
Service Manager	Dashboard	Full service side (jobs, scheduling, parts), inventory editing and deletion, sees all customer records
Salesperson	Deals board	Create customers and deals, work their pipeline, edit inventory, use Ari, text customers. Cannot reassign customers or manage the team
Technician	Service Schedule	See jobs, clock in/out, take photos, write notes. No sales or admin surfaces — their app is deliberately simple

New employees: they create an account at the sign-in screen, and they start as a Salesperson. An Owner/Manager then sets their real role in **Settings** → **Team & Permissions** (one dropdown). See §15.

Finding Your Way Around

The top bar is organized around the two sides of the business, and each side wears its color:

- **Dashboard** — the manager's home (neutral)
- **SALES** group (blue): **Deals** and **Inventory**
- **SERVICE** group (green): **Schedule**
- **Comms** and **Reports** (neutral)

The active page glows in its side's color — blue means you're selling, green means you're serving. On phones, the same menu lives behind the ■ button.

The rest of the top bar

- **Search (■K or Ctrl+K)** — search everything at once: customers, deals, jobs, and inventory. Press Enter to open the top result.
- **Location pill** — switch between All Locations, Minot, and Bismarck. This filters the whole app: deals, schedule, and inventory all follow.
- **Bell** — notifications: team messages, deals won on your customers, inbound texts. Click one to jump to it; "Mark all read" clears the count.
- **Your name** — profile, Settings, and Sign Out.

The Contacts rail (admin panel)

On desktop, a slim strip on the right edge expands into the Contacts panel: search any customer, jump to their card, or start the New Customer flow. It stays collapsed until you need it and remembers your preference. Technicians don't see it.

The manager's at-a-glance view. The period selector (This Week / This Month / Last Month) drives the numbers — nothing on this screen is decorative.

- **Total Revenue** — real closed-won deal value in the selected period
- **Active Deals** — everything open on the board right now
- **Unscheduled Jobs** — what's sitting in the service queue
- **Parts Overdue** — parts past their expected arrival

Revenue Overview charts closed-won revenue by day (week view) or by week (month views). **Requires Attention** lists your overdue tasks and — critically — **stagnant parts**: any part past its ETA or ordered 14+ days ago with no ETA shows here with a link straight to its job, so nothing sits unnoticed for weeks.

The + New button creates from anywhere: choose **New Customer** (runs the guided sales intake, §6) or **New Job** (jumps to the Schedule with the job form already open and your store pre-selected).

The Live Sales Board

The scoreboard above the pipeline — the modern version of the whiteboard in the sales meeting. It updates in real time on every screen the moment a card moves:

- **Open Pipeline** — total value on the board; flags money “sitting idle 7d+”
- **Won This Month** — closed revenue and deal count
- **Closing This Week** — deals with expected close dates in the next 7 days
- **Hot Leads** — High-priority deals (could close within a week)

The pipeline (kanban)

Eleven stages, left to right: No Contact Made → Contact Attempted → Contact Made → Showroom Visit Scheduled → Showroom Visit Complete → Estimate Sent → In Discussion → Verbal Commitment → Deposit Received → **Closed – Won** / **Closed – Lost**. Drag a card to move it.

Anatomy of a deal card:

- Colored left edge = priority (red High, amber Medium, blue Low)
- Customer name, dollar value, and what they're interested in
- **■ No follow-up** — this deal has no open task. House rule: a lead without a follow-up is an immediate no-no. Fix it on sight.
- *** Nd idle — going cold** — no activity in over 7 days. That's money walking out the door.

Winning a deal (the handoff)

Drag a card into **Closed – Won** and the system does the paperwork: a **Delivery job** is created in the service unscheduled queue (titled like “Wyant – Hot Tub – Delivery” with the amount to collect), the customer is promoted from Lead to Customer, and the service managers get a notification. Sales never has to remember to tell Service.

Sales — Adding a Customer

Every new customer enters through the guided flow (+ **New Customer** on the Deals board, the Dashboard, Contacts, or the rail). Five quick steps, chips instead of typing wherever possible, and a progress bar that starts at 20% because the follow-up step is already pre-filled for you:

- **1. Who is this?** Name and phone. As you type, matching existing customers appear — **click a name** to open their card instead, or **Use for this deal** to attach them.
- **2. How did they find us?** Walk-in, Website, Referral, Ad, Phone, Event, Other. Pick honestly — this drives marketing decisions.
- **3. What are they interested in?** Hot Tub, Swim Spa, Sauna, Cold Plunge, Game Room, Parts & Chemicals — plus an optional estimated value.
- **4. How hot?** High = could close within a week. Medium = 2–4 weeks. Low = long-term nurture.
- **5. First follow-up (required).** Defaults to two days out. This is the no-lead-left-behind rule, enforced by the form itself.

One tap creates the contact, the deal (in stage one), and the follow-up task together — then lands you on the board with the new card glowing.

■ *Duplicate protection: if the phone number matches someone already in the system, the wizard shows them before you can create a twin. No more merging duplicate customers.*

Customer Records & Commission Integrity

Every customer belongs to a salesperson, and the system protects that everywhere:

- The customer card shows an ownership chip — **“Andrew’s customer”** — at all times.
- Anyone can still edit the record (fix a phone number, add a note), but **edits by non-owners are logged automatically** as a visible note: who changed what, with the owner restated.
- If you start a deal on someone else’s customer, the deal and its follow-up task are **credited to the owner** — you’re logged as the person who entered it, and the owner gets a notification.
- Only managers can reassign a customer, and reassignment writes a from → to note on the record.

The principle: nothing is locked, everything is witnessed. Work never stalls waiting for the right person, and commission disputes are settled by the record, not by memory.

The live floor for both stores — the Excel workbook, retired. The store switcher at the top (**All / Minot / Bismarck**, with live counts) is the main move; it re-scopes the whole app, not just this page.

Stat cards: Total Units in Stock, Sold (Awaiting Delivery), On Order, and Low Stock Alerts (chemicals running thin). All follow the selected store.

Editing

- **Quick edits:** click any cell in the table (product, category, status, price) and type.
- **The full editor (pencil icon or Add Item):** a side panel with chips for brand, category, store, and status; pricing with a **live margin readout** (sale minus cost, in dollars and percent); dates; warranty; notes.
- **Mark Sold:** one tap sets the status, stamps the date, and asks which customer bought it — linking the unit to their record.
- **Delete** (managers only): two-step confirm. Gone means gone.

Inventory status	Meaning
In Stock	On the floor or in the warehouse, sellable (includes floor models — noted on the unit)
Sold	Sold, still on our hands — awaiting delivery
On Order	Ordered from the manufacturer, not yet arrived (order refs in the notes)
In Transit	Shipping to us
Delivered	In the customer's backyard — out of inventory
Returned	Came back; needs disposition

■ When a discounted unit has an MSRP, the price column shows the MSRP struck through next to the sale price — the shelf-tag talking point, built in.

Service — The Schedule

Built to feel like the Jobber board the crew knows — same color language, same drag-to-schedule — with the queue on the right and the calendar front and center. Day, Week, and Month views; phones open to Day.

Color	Status	What it means
	Delivery	A delivery to get on the truck
	Warranty	Warranty work
	Parts on Order	THE part hasn't arrived — black means we're waiting. Check these daily.
	In Progress	Standard service work
	Ready for Pickup	Done and waiting on the customer
	Completed (struck through)	Finished — struck through, just like the old board

Drag to schedule — the core move

- Drag a job from the **Unscheduled queue** onto any day — it lands at 9:00 AM (set the exact time on the job page)
- Drag a scheduled job to a different day to reschedule — its time comes with it
- Drag a job back into the queue to unschedule it

The color legend is a filter: click any status chip above the calendar to show only those jobs; counts update live. Click again to clear. Every day shows its visit count, just like the old board.

New Job pre-selects the store you're working in, and the title writes itself in the house format — pick the customer and type and it becomes "Wyant – Delivery" (edit it and it stays yours).

Service — Working a Job

Tap any job to open it. Built for a phone in one hand:

- **Time clock, top of the page:** big green **Start Job** on arrival, live timer while working, red **Stop Job** when done. Total time and session count show on the job.
- **Photos:** the Add Photo button opens the camera directly. Tag each shot — Proof of Delivery, Damage, Serial Number, Before, After — and it lands in the job's gallery. Photos are compressed on the phone so they don't eat your data plan.
- **Notes:** the running log — "delivery went well, customer paid by check" or the part number that's needed. Every note is signed and timestamped.
- **Click-to-edit everything:** status, type, schedule time, amount to collect — click the value, change it, done.

Ari — Your AI Sales Assistant

Ari is the sales brain in the chat bubble (bottom-right, everywhere). He's named for the most tenacious closer in the business, and he acts like it — a lead going cold offends him. He is a work tool: ask him anything about customers, deals, products, or selling, and he answers from the store's live data. Ask him anything else and he'll politely steer you back to work.

What Ari does

- **Knows your pipeline:** “What deals do I have going?” — “Pull up the Wyant deal” — he reads the live board, the customer's history, notes, and open tasks before answering.
- **Drafts documents, ready to copy:** one-page proposals (with the MSRP anchor built in), special offers with real expiry dates, trade-in offers, follow-up texts, and five kinds of email — post-visit follow-up, proposal cover, 30-day re-engagement, delivery confirmation, review request.
- **Coaches objections:** “they said it's too expensive” gets you the reframe and the exact words — price-per-day math, total cost of ownership vs. buying online, the spouse play, the think-about-it isolation. Ask for an Objection Response Card to keep.
- **Works the records:** he can create contacts, deals, notes, and tasks, move deal stages, and schedule jobs — always confirming before he writes anything.

Conversations

Every chat with Ari is saved as a conversation. The clock icon opens your history (titled by your first message); the pencil-square starts a fresh one; hover a conversation to delete it. Opening the bubble resumes where you left off.

What Ari won't do

- Invent numbers — anything he can't verify comes back as [CONFIRM: ...] for you to fill
- Discounts over 15% — he flags those for a manager
- Suggest reassigning someone's customer — that's a manager action
- Chit-chat, homework, or roleplay — he's on the clock

Messages

The chat bubble is one communication surface for the whole team. The back arrow from any chat opens the **Messages directory**: Ari at the top (he's a teammate who happens to be an agent — always on), the **Main** channel that reaches everyone, your recent one-on-ones, and the team roster. Team messages update live on everyone's screen and ring the bell for people who aren't looking.

Customer Texting

The house rule stands: **no customer contact from personal phones**. SPAS 360 texts from the business number **(701) 929-9194**, and every conversation is visible to management in **Comms → Customer Messages** — accountability and coaching, built in.

- Send from any customer's SMS thread; delivery failures show up honestly instead of pretending
- Inbound texts file themselves to the right customer by phone number; unknown numbers automatically become new Leads so nothing is ever lost
- The assigned salesperson and managers get notified on every inbound text

■ *Activation status: the pipeline is built and deployed. To switch it on: add the Twilio credentials in Vercel (see §16), point the Twilio webhook at /api/sms-inbound, and complete A2P 10DLC business registration (register Magic City Home Leisure as the brand) to text real customers. Until then, texting works only to verified test numbers.*

Reports

The numbers, period-selectable like the dashboard: **Closed Revenue**, **Open Pipeline**, **Open Jobs**, and **In-Stock Value** up top; then revenue by location (Minot vs. Bismarck), pipeline value by stage, service jobs by status, and inventory by status with an aging view of how long in-stock units have been sitting (0–30, 31–90, 90+ days). Everything reconciles with the pages it summarizes — same data, same math.

Settings & Team Management

Team & Permissions (Owner/Manager only) is where people management happens: every teammate with a role dropdown and a home-store dropdown. New signups appear here as Salesperson — set their real role once and they're fully equipped. You can't demote yourself, so you can't lock yourself out. Settings also shows your profile, both store locations, and Sign Out.

Adding an employee, start to finish: (1) they sign up at the login page → (2) you set their role in Team & Permissions → (3) set their home store so their forms default correctly. Done.

The accounts behind the app

Service	What it runs	Cost
Vercel (project: spas_360_solo)	The app itself — updates deploy automatically	Plan-dependent
Supabase (project: spas-360)	Database, sign-ins, file storage, realtime	\$10/month
Twilio (+1 701 929 9194)	Business texting	Number ~\$1.15/mo + per-message + A2P fees
GitHub (spas_360_solo)	The code	Free
AI provider (Gemini / GLM / Claude)	Ari's brain — switchable without changing the app	Usage-based

Open items (do these before wide rollout)

- **1. Lock down open sign-up.** Anyone with the URL can currently create an account that joins the company. Disable public signups in Supabase Auth settings once the team is aboard — this is the most important security item.
- **2. Activate texting.** Vercel → Settings → Environment Variables: add TWILIO_ACCOUNT_SID, TWILIO_AUTH_TOKEN, TWILIO_FROM, SUPABASE_SERVICE_ROLE_KEY; redeploy; set the Twilio webhook to <https://spas360solo.vercel.app/api/sms-inbound>; complete A2P 10DLC registration.
- **3. Import the Bismarck inventory tab** (Minot and Used are already loaded — 110 units).

Security model, in one paragraph

Every piece of data is protected at the database level (row-level security): people only see their company's data, tasks are visible to their owner and managers, notifications are private, deletion rights are manager-only where it matters, and job photos live in storage with unguessable addresses. The AI guardrails are enforced on the server — they can't be stripped from a browser.

Roadmap

QuickBooks sync (customers/estimates first) · install-to-home-screen app for techs · automatic reminders for stagnant parts and overdue follow-ups · @Ari in team channels · role-based page restrictions beyond landing pages.

The Style Guide — Design Law for Builders

This chapter is for anyone — human or AI agent — who builds on SPAS 360. These aren't suggestions; they are the design law that keeps the product feeling like one hand made it. The deep engineering companion (architecture, gotchas, infrastructure IDs) is **HANDOFF.md** in the repo root; this chapter is the visual and experiential contract.

Design tokens — use these names, never raw palette colors

All colors are Tailwind v4 tokens defined in `src/index.css`. If you type a raw Tailwind color (slate-, sky-, gray-) for a surface or accent, you're doing it wrong.

	Token	Hex	Used for
	ink-950	#0a0a0f	Page background
	ink-900	#111116	Cards, panels, the header
	ink-850	#16161b	Raised surfaces, dropdowns
	ink-800	#1e1e24	Hover states
	ink-700	#2a2a32	Borders (the default)
	ink-500	#6b7280	Muted text, labels
	ink-400	#9ca3af	Secondary text
	ink-100	#f0f0f0	Primary text

	Token	Hex	Used for
	brand-400	#34a0ff	Accent text, active icons, links
	brand-500	#1075b8	THE brand blue (from magiccityhomeleisure.com) — primary buttons, active states
	brand-600	#0d629b	Button hover (hover always darkens)
	brand-900	#002e56	Deep navy — gradients, cover art

Functional colors: emerald = go/success/Service side · amber = warning/idle/sold-awaiting · red = urgent/delivery/destructive · purple = on-order · black chip = parts-not-arrived (Brandon's rule). Status tints on dark are always color-500/15 backgrounds with color-300 text — never light pastel fills.

Typography

- **Inter** for everything. Weights do the talking: bold for values and names, semibold for actions, regular for body.
- **JetBrains Mono** for money and scoreboard numerals only (deal amounts, the live board) — never for prose.
- Labels above data: 10–11px, bold, uppercase, tracked wide, ink-500.

Component language

- **Cards:** bg-ink-900 · border-ink-700 · rounded-xl. Hover: border tints brand. No drop-shadow theatrics on dark.
- **Chips for choices:** anything with ≤ 8 options is chips, not a dropdown (the wizard, the editor, the legend). Active chip = brand-500/15 bg + brand-500 border + brand-300 text.
- **Primary buttons:** bg-brand-500 hover:bg-brand-600, white text, rounded-lg, with a leading icon. One primary action per view.
- **Nav tones:** Sales cluster wears brand blue, Service wears emerald, everything else stays neutral ink — defined once in NAV_TONE (Header.tsx).
- **Destructive actions:** always two-step inline confirm (Keep / Delete) — never a browser alert, never one-tap.
- **Empty states:** icon + one honest sentence + what to do next. NEVER fake data, random numbers, or decorative dead controls.

The UX doctrine

- **Reliability first.** Real data or an honest empty state. Errors fail loudly in plain English — no raw JSON, no silent failure. If a write can be denied, verify it happened.
- **Jobber familiarity is a feature.** The crew's muscle memory (colors, drag-to-schedule, queue-on-the-right, strikethrough-done) is load-bearing. Don't modernize it away.
- **Psychology, honestly applied:** smart defaults everywhere a value is predictable · endowed progress only when genuinely pre-completed · show people the thing they just built (highlight pulse) · loss-frame idle money ("going cold") · anchor prices with struck-through MSRP. Never fake urgency or progress.
- **Every screen works at 375px.** Techs live on phones. Test mobile before shipping.
- **Nothing locked, everything witnessed:** prefer attribution (logged notes) over permission walls, except where money or data loss demands a manager gate.

Voice & writing

- North Dakota friendly, big-league competent. Short sentences. Verbs first on buttons ("Add Item", "Mark Sold").
- Speak the trade's language: visits, the queue, the board, going cold, parts on order.
- Ari stays professional-tenacious; his guardrails live server-side (api/_lib/rails.ts) and are the template for every future NDAI agent.

Do this	How
Search anything	■K (Mac) / Ctrl+K (Windows), or the Search pill
Switch stores	Location pill (top right) or the store switcher on Inventory
Add a customer	+ New Customer (Deals, Dashboard, Contacts, or the rail)
Add a job	+ New Job on the Schedule, or Dashboard → + New → New Job
Schedule a job	Drag it from the Unscheduled queue onto a day
Win a deal	Drag the card to Closed – Won — the delivery job creates itself
Clock in on a job	Open the job → green Start Job button
Job photos	Open the job → Add Photo (opens the camera, tag the shot)
Ask Ari	Chat bubble, bottom right — he opens to your last conversation
Draft a proposal	Ask Ari: “draft a 1-page proposal for [customer]”
Text a customer	Comms → Customer Messages → their thread
Promote an employee	Settings → Team & Permissions → role dropdown
Mark inventory sold	Inventory → pencil → Mark Sold → pick the customer

Priorities: High = could close within a week · Medium = 2–4 weeks · Low = long-term nurture

House rules the app enforces: every lead gets a follow-up task · no discounts over 15% without a manager · no customer contact from personal phones · the customer stays with their salesperson

SPAS 360 · Built for Magic City Home Leisure · Powered by NDAI · The Bible v1.1, July 2026
